

DFU 2 Fuel polishing unit

The DFU2 is the ultimate portable fuel-polishing unit. Removes solid particulate, diesel bug and water from diesel fuel.

The DFU2 is a larger version of the market leading DFU1. It features advanced water clean-up capabilities and a larger particulate filter to the DFU1.

The DFU2 is an ideal fuel-polishing unit for cleaning up to 10,000 Litres of stored fuel at a time, particularly where there is a large water ingress issue.

DFU2 Features

- Fuel is cleaned down to 1 micron
- Water is removed down to below 50ppm.
- Fitted with a continuously rated 50L/min pump
- Particulate filter capacity of up to 20kg of contamination
- A separate water removal filter
- Low cost

DFU2 Benefits

- Ideal for difficult to access areas
- Easy to transport
- Uses standard 220VAC mains electric

The DFU2 has a 2-stage approach to water removal, a coalescer water filter before a VF609 water adsorption element. The Coalescer element removes free water from fuel, which can then be drained off.

On-line particle counter fitted to give live readings of fuel or oil cleanliness. Having a laser particle counter fitted can help the Service Engineer know when the fuel being polished has achieved the required standard.

The DFU2 can also be supplied with an on-line particle counter fitted to give live readings of fuel or oil cleanliness in real time.
